

MAMBO2 Activity supplementing set

Introduction

For athletes who like to know more about their performances, FALCOM offers the most favourable activity supplementing set. Especially for cyclists the MAMBO2- ANT-set includes a sensor for revolutions and speed; for joggers or hikers a step counter; and for all just named a sensor for the heartbeat. All data is being transferred to the MAMBO2 by means

of the ANT-radio standard, where they will be evaluated and displayed in a way which is pleasing to the eye. In order to make the data also available for coaches, tutors or doctors, they can be sent via GPRS, just as the GPS data to the server trace4you. Check up on pulse, speed and revolution is fully ensured at any time,

on the road or in front of the screen – which is a pre-condition for optimum and effective training.
