

MAMBO2 Kid's phone

Introduction

Wouldn't you too like to know just every now and then where your offsprings are spending their pastimes in this big city? Or: must you always pass on your telephone because the telephone card is empty again? For both of these problems as well as many others a solution is available, namely: MAMBO2. By means

of the SimpleGui you define whom your child will be able to call. The handling is very easy: big self explanatory icons above the two outer buttons show the actions which can be chosen. And don't worry about distractions during lessons: When designing MAMBO2, games and multimedial functions were deliberately

avoided. Just a telephone only! Yet with all tracking functions which are the merits of the MAMBO2 and the series of AVL devices of FALCOM. These devices do their work quietly in the background in a way rendering it unnecessary for the person wearing the device to attend to it. The MAMBO2 is optionally

equipped with a radio module by means of which an indoor-localisation is possible in buildings which are fitted with the necessary equipment.

- Telephone directory which is picture and text based
- Telephone numbers which are permanently saved can be edited by means of the internet page
- Emergency calls do function also without SIM card.
- SMS and MessageBox messages
- Online Tracking / Indication of position
- Messages by means of SMS or e-mail when entering or leaving of pre-defined areas (Geofence-Function)

Allow the pictures to talk – the MAMBO2 Illustrated Telephone Book

Take photos or create your own motives, and you will be able to down load these on to the MAMBO2 by means of Web-Frontend.
